ELC 2137 Lab 4: Subtractor

Jake Simmons and Haonan Jin

February 8, 2020

Summary

In this experiment we made a subtractor from a adder. First we made an adder by combining two full adders which is a two-bit adder. Then we added three XOR Gates, this was becasue we needed to invert two of our inputs to generate the 2's complement. The third XOR Gate inverted the carry out bit because Figure 3 shows that the carry out bit in our expected results was the opposite of what mathematically it should have been.

Q&A

1. Why did we use two full adders instead of a half adder and a full adder?

   (a)

1. How many input combinations would it take to exhaustively test the adder/subtractor?

   (a)

1. Why were the combinations given in the truth table chosen?

   (a)

1. Do the results from your adder/subtractor match what you would expect from theory? Explain any discrepancies.

   (a)
